

AWS SSO + S3 — Quick Local Terminal Guide

Use this when you need to **connect to AWS**, **select an account/project**, **download an S3 bucket**, or **upload changes from your local machine**.

1. Check AWS CLI

```
aws --version
```

If it is installed, continue.

2. Configure AWS SSO

Run:

```
aws configure sso
```

Enter the details shown by AWS.

Example:

SSO session name: simplify3x

SSO start URL: <https://simplify3x.awsapps.com/start/>

SSO region: ap-south-1

A browser will open for login.

Then AWS will show the available:

AWS accounts

Roles

Select the **Account** and **Role** you need.

Example:

Account: 533267371590

Role: AdministratorAccess

Then choose your AWS CLI region.

Example:

Default client Region: ap-southeast-2

Finally, give the profile a name:

Profile name: bominso

3. Login

Every time your SSO session expires:

```
aws sso login --profile bomins0
```

Check that you are connected:

```
aws sts get-caller-identity --profile bomins0
```

If this returns your AWS account information, you're connected.

4. See S3 Buckets

```
aws s3 ls --profile bomins0
```

Example:

```
bchemistry-website-dnd  
another-project-bucket
```

5. Check a Bucket

```
aws s3 ls s3://BUCKET-NAME/ --profile bomins0
```

Example:

```
aws s3 ls s3://bchemistry-website-dnd/ --profile bomins0
```

6. Download / Clone S3 Bucket to Local

S3 doesn't use `git clone`.

Use `aws s3 sync`.

Create a folder:

```
mkdir project-name  
cd project-name
```

Download the bucket:

```
aws s3 sync s3://BUCKET-NAME/ . --profile PROFILE-NAME
```

Example:

```
aws s3 sync s3://bchemistry-website-dnd/ . --profile bomins0
```

Now the S3 contents are available locally.

7. Upload Local Files to S3

After making changes locally:

```
aws s3 sync . s3://BUCKET-NAME/ --profile PROFILE-NAME
```

Example:

```
aws s3 sync . s3://bchemistry-website-dnd/ --profile bominso
```

This is:

Local → S3

8. S3 → Local vs Local → S3

Remember this:

S3 → Local

```
aws s3 sync s3://BUCKET-NAME/ . --profile PROFILE-NAME
```

Local → S3

```
aws s3 sync . s3://BUCKET-NAME/ --profile PROFILE-NAME
```

9. See What Will Change

Before uploading, you can check:

```
aws s3 sync . s3://BUCKET-NAME/ --profile PROFILE-NAME --dryrun
```

This is recommended before a real upload.

10. Delete Files from S3 That Don't Exist Locally

⚠ Be careful with `--delete`.

```
aws s3 sync . s3://BUCKET-NAME/ \  
  --profile PROFILE-NAME \  
  --delete
```

Only use this when you are sure the local folder should exactly match S3.

11. Useful Commands

List profiles

```
aws configure list-profiles
```

Check current AWS identity

```
aws sts get-caller-identity --profile PROFILE-NAME
```

List buckets

```
aws s3 ls --profile PROFILE-NAME
```

List bucket files

```
aws s3 ls s3://BUCKET-NAME/ --profile PROFILE-NAME
```

Download bucket

```
aws s3 sync s3://BUCKET-NAME/ . --profile PROFILE-NAME
```

Upload to bucket

```
aws s3 sync . s3://BUCKET-NAME/ --profile PROFILE-NAME
```

Test upload without changing S3

```
aws s3 sync . s3://BUCKET-NAME/ --profile PROFILE-NAME --dryrun
```

Quick Workflow

For a new project, just follow this:

1. Login

```
aws sso login --profile bominso
```

2. Check AWS

```
aws sts get-caller-identity --profile bominso
```

3. See buckets

```
aws s3 ls --profile bominso
```

4. Create project folder

```
mkdir my-project
```

```
cd my-project
```

5. Download S3 bucket

```
aws s3 sync s3://MY-BUCKET/ . --profile bominso
```

6. Make your changes

7. Check what will be uploaded

```
aws s3 sync . s3://MY-BUCKET/ --profile bominso --dryrun
```

8. Upload

```
aws s3 sync . s3://MY-BUCKET/ --profile bominso
```

Simple rule to remember

SSO → Select Account/Role → Select Bucket → Sync

AWS SSO

Account

Role

S3 Bucket

Local Folder

aws s3 sync

This setup lets you do the complete S3 workflow **from your local terminal without creating AWS access keys.**
